700R4 - 200-4R Lockup kit

This kit is for the 700R4 and 200-4R automatic transmission. Its intention is to allow the use of a lockup style torque converter without the use of a computer.

Installation Instructions:

1. Remove pipe plug from the 4th gear pressure port (see illus.). If your 700R4 does not have a 4th gear pressure tap, you can drill & tap the servo cover (see illus.) If needed, a 90 degree brass elbow can be used so the pressure switch doesn't stick out too far.
2. Install pressure switch supplied in kit with brass adapter if needed.
3. Connect the terminal connector to either of the pressure switch prongs.
4. Run a 20 amp fusible link to the other prong of the pressure switch.
5. Plug the case connector switch from the supplied harness into your transmission case. The tab on the plug should be facing towards the front of the transmission.
6. Ground the black wire from harness to your frame.
